

In movie theaters, people would have red and blue lens that would transfer 2 dimensional display to 3 dimensional display. Nowadays people with luxurious lives are able to buy somewhat developing 3D TV. Technology has advanced beyond this two lenses. A "TV would send signals to a pair of glasses and create 3D displays"(Woods). People would still have to wear glasses until a new technology would be exposed. Some of the benefits are : "It would minimize the eye strains" (Woods). The 3D display would also make a better display. People who uses plasma screens has harder time watching the screen from different angles. They would see the plasma screen getting darker as one sees the from a higher position. With 3D displays one can see from any angles and still be able to watch TV.

Reasons to use 3D TV

People would be wanting to watch movies through 3D televisions. TV's in the future will allow people to watch in 3D contents. Not only TV's, but all other visual technology will evolve from flat 2-d screens to 3-d screens. Can you imagine playing games in 3-d contents, where a character would be coming out of the screen? People have no need to buy baseball or Super ball tickets, when they can enjoy the first row of the stadium through 3D televisions. Something that seemed impossible in the past in only becoming possible in next few years.

3D TV

† WHAT IS 3D DISPLAY? ‡

Everyday, millions of movie tickets are sold around the world. 3-dimensional televisions in the future will surely wipe the movie theater industries. TV is no more in 2D's but in 3D's

Will 3D Bring New Era??

However, making 2D display screen into 3D display is not an easy job. People with unlimited amount of luxuries will be able to see a baseball game in the first row through TV. Because 3D displays require more energy and technology more equipments are needed. "The 3D requires not only the TV itself, but a computer, a special graph card, and a content whether it is a PC game or a movie" (Woods). Not only will people be watching movies, they will be playing games. One might be able to play Warcraft or Star-craft in 3D's.

3D display is further improving. This model of watching 3D's through glasses are only keep on improving. According to Nanjaro, an expert on 3D displays imagine that in the future there will be an engine where it will send the rays that are already split into half. These two separated rays would go in two the two lenses of the glasses and produce 3D image. If Ninjaro's imagination is correct, in a few decades, people will not be needing anymore glasses.

In few years, people will be able to see something that seemed impossible become possible. Other than 3D TV's, flying cars, subways under seas will be invented. However, as people favor technology more than the meeting with other people, they should try to favor more of social meetings.
